

fluid.copy

fluid.copy(tocopy)

Performs a deep copy (clone) of the object passed in the argument.

```
fluid.copy(tocopy);
```

File name: Fluid.js

Parameters

tocopy	(Object) The object to be copied
---------------	----------------------------------

Return Value

Object	The copied object
---------------	-------------------

See Also

Notes

This function recursively copies the contents of `tocopy` into a new object of the same type.

Example

```
var oldModel = fluid.copy(that.model);
```

In this example, `fluid.copy()` is being used to preserve a copy of a model. This can be useful for scenarios where some kind of 'revert' or 'undo' might be desirable.
