

_events option description

| | |
|---------------------------|--|
| Description | An object containing key/value pairs that define the events the component will fire: the keys are the event names, the values define the type of the event (see Infusion Event System for information on the different event types). |
| Notes | The Framework will create event firers for the listed events. It is the responsibility of the component to fire the events at the appropriate times. Component integrators should NOT override event definitions. |
| Example Definition | <pre>fluid.defaults("component.name", { events: { onSave: "preventable", onReady: null }, ... });</pre> |
| Example Override | N/A |
