

# Mobile FSS Cheat Sheet

## Work In Progress

This document is a work-in-progress. This page is for documenting all Mobile FSS classnames: what they do, when to use them, and how to extend them.

**NOTE:** FSS is deprecated as of 1.5

## Introduction

Note: The Mobile FSS is [new in v1.1](#).

This article is for documents all the Mobile FSS classnames and describes what they do, when to use them, and how to extend them.

Knowledge of the core [FSS Cheat Sheet](#) is not required, although extremely useful.

Mobile FSS recycles a large number of desktop FSS class names for the sake of easy portability. Mobile FSS includes some new class names too, which are unique in their usage. While the desktop and mobile flavours of FSS are very similar, there are some important differences:

1. The `fss-mobile-layout.css` file is required.
2. The `fss-mobile-layout.css` file has theme-specific layout adjustments.
3. `fss-reset.css` is not as relevant on the mobile platform as it is on the desktop.
4. mobile FSS relies heavily on Webkit, and is currently limited to platforms that use Webkit-based browsers (eg Android, iPhone, etc)
5. Since performance on the mobile platform is very different than any other, it is **highly** recommended to reduce the amount of network traffic your page generates. Therefore, try not to include theme files you wont use, ie: don't push the iphone theme file to an android device if your not using it.

A typical mobile FSS setup looks like

```
fss-mobile-layout.css
fss-mobile-themeOfYourChoice.css
your-tweaks.css
```

...and, as always, **order is important!**

## FSS / mFSS overlapping class names

The following class names used in FSS are also used in mobile FSS, with different effects applied. Any other FSS class name has no effect unless you include the [FSS](#) files.
