

selectors option description

Description	An object containing names CSS-based selectors identifying where in the DOM different elements can be found.
Notes	The Framework will create a DOM Binder that should be used to access the elements identified by selectors. The DOM Binder attaches a function to the component object called <code>locate()</code> which retrieves the element given the selector name.
Example Definition	<pre>fluid.defaults("fluid.progress", { selectors: { displayElement: ".flc-progress", progressBar: ".flc-progress-bar", indicator: ".flc-progress-indicator", label: ".flc-progress-label", ariaElement: ".flc-progress-bar" }, ... });</pre>
Example Override	<pre>var myEdit = fluid.progress(container, { selectors: { indicator: "div.progress-indicator", label: "span.progress-label" }, ... });</pre>
